Continuation of 11. does NOT place the application in condition for allowance because: Applicant's arguments, see pages 2-3 of the Remarks section, filed 5/28/2008, with respect to the rejections of the claims have been fully considered and are not persuasive. Claim 1: Applicant argues that Cheng fails to teach recited sequence number originating within first component. Applicant adds in Cheng, the sequence number used by the MAC is received from the RLP layer (paragraph [0064) of Cheng); that is, the sequence number does not originate in the MAC. However, Examiner respectfully disagrees with the Applicant's assertion. Chiang teaches generate packets such that data values within the generated packet payloads include data originating within the first component (section 0030, depending on the types of objects, various management information data are included in the control packet CP, for example the number of received packets, number of transmitted data, colliding packets, CRC error, over-sized packets, under-sized packets, packet settings, packet parameters and/or specially defined packet particulars). Chiang and Raphaeli do not explicitly teach the data comprise a sequence number. Cheng in the same field of endeavor teaches MAC response comprises a sequence number (paragraph 0065). As such Chiang in view of Raphaeli and Cheng teaches the cited limitations. As such, in response to applicant's arguments against the references individually, one cannot show nonobviousness by attacking references individually where the rejections are based on combinations of references. See In re Keller, 642 F.2d 413, 208 USPQ 871 (CCPA 1981); In re Merck & Co., 800 F.2d 1091, 231 USPQ 375 (Fed. Cir. 1986).

In response to Applicant's argument that the sequence number does not originate in the MAC, Examiner respectfully points out that in paragraph 0065, Cheng states in the RLP transmitter, i.e., the RLP layer 76-12 with the feedback (emphasis added) from the MAC sublayer, the RLP layer initiates a subsequent round of retransmission procedures without waiting for the NAK control frames from the RLP receiver (the layer 76-22, shown in FIG. 2). At the end of the transmission, the status is passed up to the RLP layer. Finally, Table in paragraph 0065 clearly shows response from MAC to RLP has sequence number within the response packet. Regardless, the claim language does not require that sequence number originating (emphasis added) within first component, rather as claim language states "the data originating within the first component is to comprise (emphasis added) a sequence number".

Further, Applicant's argument regarding MAC layer is not part of the claim, i.e. in response to applicant's argument that the references fail to show certain features of applicant's invention, it is noted that the features upon which applicant relies (i.e., MAC layer) are not recited in the rejected claim(s). Although the claims are interpreted in light of the specification, limitations from the specification are not read into the claims. See In re Van Geuns, 988 F.2d 1181, 26 USPQ2d 1057 (Fed. Cir. 1993).

Claim 8: Applicant argues claim 28 recites similar limitation without giving any other details.

Applicant's arguments fail to comply with 37 CFR 1.111(b) because they amount to a general allegation that the claims define a patentable invention without specifically pointing out how the language of the claims patentably distinguishes them from the references. Applicant's arguments do not comply with 37 CFR 1.111(c) because they do not clearly point out the patentable novelty which he or she thinks the claims present in view of the state of the art disclosed by the references cited or the objections made. Further, they do not show how the amendments avoid such references or objections.
